This report has been produced by Henham Strategy, having been commissioned by Pioneer Group and The Crown Estate.

About Pioneer Group

Pioneer Group's mission is to help life sciences and high-tech businesses thrive in tackling human and planetary health challenges. Across the UK and Ireland, Pioneer leads the way in integrating the provision of mission critical real estate, venture building and venture investment. Since 2003, its connected cluster model has provided powerful sector-specific, business-focused ecosystems in which businesses are more likely to succeed.

Real Estate – As a leading developer and operator of life science and high-tech campuses, Pioneer Group manages over £1 billion of real estate (over 4 million square feet) in 12 leading innovation locations across the UK and Ireland. Pioneer's campuses offer a range of flexible, specialist laboratories, industrial and office space to support scientists, technologists, engineers and entrepreneurs on every step of the innovation journey from R&D to manufacturing. Pioneer's campuses are home to organisations ranging from start-up to multinational.

Venture Building and Venture Investment – Pioneer Group delivers the most comprehensive suite of accelerator and venture building activity across the UK and Ireland, helping founders to transfer cutting-edge discovery into visionary ventures that scale. Pioneer's in-house team supports start-ups and scale-ups while partnering with organisations such as Innovate UK, AbbVie, Novo Nordisk, the Health Innovation Networks and many of the UK's strongest universities. Pioneer also backs game changing, early-stage life science companies with investment from its venture capital funds, alongside ongoing mentoring and assistance. The focus is on funding the most promising companies graduating from Pioneer's venture building programmes and/or based at its campuses.

Ecosystem – Pioneer Group has curated a trusted community of 1000+ experts, mentors, venture partners, corporates, clients and accelerator alumni, operating in the most exciting areas of life sciences and high-tech innovation. Pioneer supports companies with access to capital, mentoring, finding customers, hiring talent, choosing the right infrastructure, and much more. It leverages cross-sector collaboration through a wide-ranging events programme, online networking and personal introductions to key contacts within the wider collective.

For more information about Pioneer Group, visit www.thepioneergroup.com.

About The Crown Estate

The Crown Estate has a diverse £15bn portfolio that includes urban centres and development opportunities; one of the largest rural holdings in the country; Regent Street and St James's in London's West End; and Windsor Great Park. We also manage the seabed and much of the coastline around England, Wales and Northern Ireland, playing a major role in the UK's world leading offshore wind sector.

We are a unique business established by an Act of Parliament, tasked with growing the value of the portfolio for the nation and returning all of our net profit to HM Treasury for the benefit of public spending. This has totalled £5bn over the last ten years.

Through our activities and investments, The Crown Estate creates environmental, social and financial value both for now and into the long term. This includes:

- Playing a significant role in unlocking renewable energy for millions of homes through sectors such as offshore wind and creating opportunities for new technologies like CCUS and hydrogen to deliver the UK's energy security transition, resulting in thousands of jobs for communities across the UK.
- Supporting the sustainable transformation of land use in the UK through diversified, regenerative agricultural and environmental best practice alongside a thriving natural world.
- Becoming recognised as a centre of excellence for environmental and ecological best practice across the Windsor Estate.
- Identifying and creating opportunities for thriving and resilient communities across the country to support regeneration, housing and innovation.
- Ensuring London retains its global city status, by fostering a more vibrant, greener and inclusive destination for millions of visitors and businesses.

Foreword

In the foreword for the first phase of this report, I wrote:

'Today, we stand at a pivotal moment.

Our global geopolitics is shifting on its axis. There is ever growing pressure on human health and an urgent need to protect our planet. At the same time, the world is entering a new kind of race – not for territory or trade – but for next generation technologies.

Governments everywhere are waking up to the importance of these technologies to both national security and prosperity as well as the dramatic impact that artificial intelligence will have on scientific discovery and development.

British universities are often leading the way in new discoveries, but their position is not guaranteed as well-funded corporates and challenger nations enter the race. In today's commercial world, universities must convert their innovation into real world impact to remain relevant.

Together, this is creating a once in a generation 'must seize' opportunity for the life sciences and innovation economy in the UK.'

And today I believe those words ring even more true than they did just six months ago.

The challenges we face have been further evidenced by recent reports, most notably by The House of Lords Science and Technology Committee, UK Research and Innovation and most recently the House of Commons Science and Technology Committee.

The question now is 'what do we do about it'? Restating the problems and wringing our hands is not enough; we need to get into the detail of the design and delivery of solutions.

Yes, we need to unlock deep pools of capital for UK innovation, but we also need to invest in the infrastructure and people that enable it, to give everyone the best possible chance of success.

In this next stage of our report, we shine a light on the areas of venture building, real estate and people. We offer the invitation to discuss and debate the challenges in these areas, but we do so with an intent to design and deliver solutions that align activities.

At Pioneer Group we work, alongside many others, at the coalface of the efforts to commercialise, house and scale UK innovation. We want to collaborate with the private and public sectors to jointly develop an effective blueprint to capitalise on UK science for maximum success for all.

Through this report we invite you to join us in doing so.

Toby Reid
Executive Director
Pioneer Group

Executive Summary

The UK is a global leader in research excellence, producing world class science and seventeen top 100 universities. Yet this strength does not consistently translate into the high growth companies that define an internationally competitive innovation economy. As Phase One of this programme demonstrated, restricted access to early-stage capital remains a critical bottleneck - particularly outside the Golden Triangle - limiting the number, quality, scale and geographic spread of academic spinouts. Addressing this gap could unlock more than 1,700 additional ventures, create over 56,000 high quality jobs and generate up to £27 billion in co-investment. But capital alone is not enough.[1]

Across political, industry and academic stakeholders, there is now a clear consensus: **the UK faces a systemic commercialisation challenge.** The House of Lords, the House of Commons, UKRI and HMG all identify the same core weaknesses - insufficient specialist support for founders, an acute shortage of fit-for-purpose laboratory space and a widening skills gap across technical, analytical and commercial leadership roles. These non-financial constraints increasingly limit the UK's ability to convert scientific breakthroughs into investment-ready and scalable ventures.

Phase Two of this work shifts the conversation from capital alone to the broader commercialisation ecosystem. The report focuses on three interdependent enablers that determine whether early-stage technologies successfully progress to market:

1. **Venture Building.** Early commercial support that helps founders test markets, refine business models, validate customer need, de-risk propositions and build investable teams. Evidence shows this support is inconsistent, fragmented across regions and therefore not universally available to promising ventures.

2. **Real Estate and Critical Equipment.** The laboratories, prototyping facilities, specialist infrastructure and shared equipment that allow spinouts to grow. The UK's shortage of flexible, high spec lab and technical space - particularly outside the Golden Triangle - is now a structural barrier to growth.

3. **Talent and Skills.** The technical, operational and commercial expertise required at each stage of the commercialisation journey. Demand for these skills is rising sharply, with acute shortages emerging across research, engineering and laboratory roles, as well as experienced C-suite teams capable of scaling science based companies.

To provide clarity across this complex landscape, the report introduces a **new UK commercialisation taxonomy,** mapping nine stages from early discovery (TRL 1–2) through to maturity (TRL 8–9). For the first time, this creates a shared framework that links scientific progress with commercial requirements.

The taxonomy highlights the true complexity of the commercialisation journey, showing the extent to which demand for different enablers varies between early discovery, proof of concept development, spinout formation, early market embedding and scaling. For policymakers and investors, it creates a more precise understanding of when specific forms of support - capital, skills, space and venture building - are most critical.

Our research also reveals an accelerating demand–supply imbalance: insufficient venture building capacity, a shortage of specialist facilities and a limited pipeline of technical and commercial leaders. Without intervention, these constraints will intensify if and when new capital enters the system and the volume of spinouts continues to grow.

This report therefore seeks input from government, academia, investors, developers and industry practitioners to shape a more coherent national strategy. This includes identifying the most mission critical components of venture building, forecasting future demand for specialist space and skills and determining how the UK can take a coordinated, purpose-led approach to strengthening its commercialisation infrastructure.

The message across the evidence base is unambiguous: **the UK is aligned in diagnosing the problem, and now is the moment for government, industry and academia to design the solution together.** Unlocking the full commercial potential of UK research will require targeted, equitable investment not only in capital, but in the environments, capabilities and leadership that enable research to become globally competitive companies.

Through further consultation, Phase Two aims to provide the operational blueprint for meaningful collaboration - ensuring that innovation emerging across every part of the UK has the ecosystem, resources and opportunity needed to succeed.

1 Bridging the Capital Gap for UK Research Commercialisation, Pioneer Group.

Introduction

Our previous report, *Bridging the Capital Gap for UK Research Commercialisation*, highlighted the exceptional strength of the UK's innovation ecosystem. The UK ranks third globally for research publications per capita and is home to seventeen universities listed in the QS World University Rankings' top 100. We are a recognised leader in early-stage technology development, positioning the UK as a global hub for research and innovation. Yet these advantages too often fail to translate into the thriving, high growth businesses they should. The primary obstacle: restricted access to early-stage capital.

Despite the UK's global status as a leader in science, commercial potential is repeatedly constrained by financial bottlenecks. Over the past decade, the UK produced 1,358 spinouts that attracted £8 billion in venture capital. However, this success remains heavily concentrated in one part of the country. Although 69% of the UK's research power lies outside the "Golden Triangle" of London, Oxford and Cambridge, since 2010, these regions have received only 15% of spinout VC investment. Indeed, 85.2% of all VC raised by UK spinouts flowed into the Golden Triangle, including a striking 93% of late-stage capital (Series B onwards).

In Phase One, we demonstrated this location disparity, and that addressing early-stage capital constraints could be transformative. A £15.2 billion investment in early-stage commercialisation over the next decade, for example, could generate 1,771 additional spinouts beyond business as usual projections and attract a further £27.4 billion in co investment. These new ventures could create approximately 56,000 high quality jobs and deliver an estimated return on investment of between 2x and 7.5x.

It is increasingly clear that meaningful support for innovative companies is finally gaining momentum. Shortly after Phase One was published, the House of Lords Science and Technology Committee released *Bleeding to Death: the science and technology growth emergency*, which both reinforced and broadened our findings - most notably the chronic shortage of scale-up capital. These challenges are echoed across the wider evidence base. UKRI's recent *Deepening University–Investor Links* report highlights persistent funding gaps at both pre-seed and scale-up stages, alongside the need to strengthen institutional capability. The Women and Equalities Committee has further underscored that women-led businesses continue to receive disproportionately low levels of venture and equity investment. And most recently, the House of Commons Science, Innovation and Technology Committee's *Flying Blind: Innovation, Growth and Regions* report points to significant untapped innovation potential outside the Golden Triangle.[2,3,4,5]

There is no disagreement: the UK needs significantly more equitable capital to help innovative companies start, scale and grow.

But intervention cannot stop at capital. Our Phase One conclusion - that unlocking the commercial potential of increased investment requires the UK to build the wider commercialisation infrastructure around it - has never been more urgent, and it is clearly a shared concern. The House of Lords' Select Committee warned that the UK faces a national "growth emergency" driven by structural weaknesses across its science, innovation, infrastructure and commercialisation systems. It also underscored the non-financial barriers suppressing innovation, most notably acute skills shortages and persistent talent leakage, which continue to constrain the UK's ability to turn world-leading research into world leading companies.

These reports mark an important evolution in the policy conversation. While tackling the capital gap is essential, **capital alone is not enough.** Even if the UK eased early-stage financial constraints and significantly increased spinout creation, additional systemic constraints would quickly surface. To fully realise the commercial potential of British science, the UK requires a broader and more resilient commercialisation infrastructure. This Phase Two report focuses on the importance of capital investment, and broadens the conversation to consider three other critical enablers of successful research commercialisation:

- **Venture building** – the support required to turn a scientific discovery into a viable company, including founder development, venture design, market validation, team formation, governance and investor readiness.
- **Real estate and equipment** – the laboratories, prototyping facilities, collaborative workspaces and high value specialist equipment essential for developing and launching new technologies.
- **Talent and skills** – the skills needed to work in and sustain high growth innovation led companies.

With HMG now having published its response to the House of Lords' Science and Technology Committee's report, political recognition of these financial and non-financial barriers has reached a new peak. Their response acknowledged that firms struggle across multiple stages of growth, and that improving the innovation ecosystem requires more than capital, including support around "procurement, skills, infrastructure and regulation." Pioneer Group, in collaboration with The Crown Estate, is delighted to build on this recognition and momentum in Phase Two and offer a forum to develop an operational blueprint for how industry and Government can work together to unlock innovation from every angle.

This report is therefore a call for input, inviting perspectives from across the commercialisation landscape to help shape a stronger, more coherent and more ambitious national approach.

Call for input

The purpose of this report is to spark meaningful discussion, not to present a complete answer. While this phase of research has given us a strong foundation, critical questions remain. For example, how do we ensure future policy and strategy goes beyond capital to encompass the wider ecosystem of commercialisation?

Within each section, we outline priority research questions for which input is being sought to help shape robust, evidence-based policy proposals that can strengthen long term research commercialisation and unlock further investment.

Future phases of work will focus on using that insight to:

1) Identify the most mission critical components of venture building, talent development and real estate.
2) Quantify the anticipated increase in demand for these essential enablers.
3) Engage with government to explore how the UK can effectively respond to this heightened demand.

Please submit all responses to: beyondthecapitalgap@henhamstrategy.co.uk

2 Bleeding to Death, House of Lords Science and Technology Committee.

4 Female entrepreneurship, Women and Equalities Committee.
5 Flying Blind: Innovation, Growth and the Regions. House of Commons Science, Innovation and Technology Committee.

Building a Taxonomy

Currently, there is no single, widely accepted taxonomy for UK research commercialisation. Instead, different organisations have mapped the journey through their own perspectives and frameworks. Universities such as St Andrews and Oxford have outlined the procedural steps academics must navigate to spin out a company, managing intellectual property, securing governance approvals and completing incorporation. Investor-focused bodies, such as the ScaleUp Institute, take a different view, emphasising financial and growth metrics including funding rounds, market traction and the characteristics of high growth firms.

While each perspective provides valuable insight, this fragmented landscape only describes the starting and end point of a spinout's journey but leaves the practical middle largely unaccounted for. As a result, we lack a clear, shared understanding of how research is translated into an investable, scalable business, and the operational steps and support systems needed to get there.

The purpose of our taxonomy is to create a common framework that connects the early-stages of commercialisation with the later phases of scaling and growth, offering a clear view of the entire pathway. It reflects our Phase One finding that, while access to capital is a critical constraint, investment alone is not enough to increase the number and quality of academic spinouts. It also recognises that the type and scale of funding required shifts significantly as ventures mature, from early grants and pre-seed support through seed, Series A and later-stage growth capital, and that these financing stages typically align with specific technical and commercial milestones.

To accurately represent the multifaceted nature of research commercialisation, we drew on two principal perspectives in shaping the taxonomy:

1. **Spinout formation practice:** The University of St Andrews Spinout Guide enables us to reflect real institutional decision points, and the replicable steps founders typically move through during the commercialisation process.[6]

2. **Technology Readiness Levels (TRLs):** UKRI's nine-level TRL framework is widely used in UK funding contexts to describe technical maturity across different sectors, making it a common parlance for discussing how proven a technology is.[7]

While every effort has been made to accurately map TRLs onto the commercialisation journey, they only measure the maturity of the technology and fail to account for whether a venture has the resources and capability required to scale. For that reason, TRLs are treated as a technical "spine" that runs through the pathway, while the taxonomy itself describes the non-technical conditions that determine whether technical progress translates into an investable business.

The finalised taxonomy provides the framework for the remainder of this report. We are now seeking feedback and comments on its design.

6 University of St Andrews Spinout Guide
7 Technology Readiness Levels, UKRI (Innovate UK).

A New UK Commercialisation Taxonomy

Stage 1 **Discovery and Ideation (TRL 1–2)**	Frontier research exploring real world applications. Focus on novel ideas and potential IP; no product or business plan. Funding is grant-led.
Stage 2 **Opportunity Shaping (TRL 2–3)**	Tests commercial viability through early feasibility studies, market analysis, customer discovery and commercial de-risking. Funding is small scale, aimed at justifying technical development.
Stage 3A **Initial Technology Development: Proof of Concept (TRL3–4)**	Demonstrates core functionality under controlled conditions. Includes early prototyping and draft business planning. Funding mixes proof-of-concept grants and pre-seed capital.
Stage 3B **Later Validation and Translational Readiness (TRL 4–6)**	Moves testing into relevant environments, builds adoption pathways and partnerships. Funding often pre-spinout or seed positioning.
Stage 4 **Spinout Approval and Deal Structuring (TRL 4–6)**	Secures university approval, IP licensing, and share allocations. Typically precedes seed investment.
Stage 5 **Company Formation and Initial Operations (TRL 4–6)**	Incorporation, early hires, pilots, and governance setup. Seed funding deployed to build operational capacity.
Stage 6 **Early Growth and Market Embedding (TRL 5–6)**	Strengthens governance, expands team, and deepens customer validation. Prepares for Series A fundraising.
Stage 7 **Scaling (TRL 7–8)**	Builds delivery capacity and leadership, evidences technology in operational environments. Aligns with Series A/B financing.
Stage 8 **Expansion (TRL 8)**	Industrialises delivery, enters new markets, and secures regulatory approvals. Requires later-stage growth capital.
Stage 9 **Maturity (TRL 8-9)**	Sustained operations, strategic exit, or IPO. Funding shifts to late-stage rounds or acquisition financing.

Venture Building

Venture building is the process of taking a technology or idea that has a commercial application and converting it into a financially viable and investable venture.

Successful spinouts aren't created overnight. Building companies with strong IP, real market need and strong leadership takes time. Dedicated effort is needed to turn promising technologies into ventures that investors can believe in.

However, there's no shared view on what 'best practice' looks like. Venture building support is patchy across regions and over time. This inconsistency is stifling innovation and leaving huge amounts of UK technological potential untapped.

To commercialise UK science at the level our Phase One analysis shows is possible, policymakers, academia, industry and Government must join forces to answer three crucial questions:

- What forms of venture building deliver the greatest impact?
- Is there a single most effective model for generating the highest quality commercial opportunities from UK research, or is a blended approach required?
- How should venture building activity be sustainably funded and how can we ensure that provision is equitable?

Based on our targeted engagement with stakeholders and supporting research, we have set out the core principles of venture building as they apply to UK research commercialisation. These principles offer a common framework to guide constructive collaboration and help realise the full potential of UK innovation.

Venture Building and UK Research Commercialisation

The purpose of venture building is to drive business creation and innovation. Loosely defined as creating businesses from the ground up, it has been proven that start-ups in venture building programmes consistently outperform their peers, secure more funding, generate higher revenues, create more jobs and achieve greater longevity. However, venture building itself is a catch-all term, with the actual activity ranging from accelerator programmes to venture capital itself.[8]

Whilst the House of Lords Select Committee report, Bleeding to Death, does not explicitly mention venture building, it does highlight the lack of specialist support needed to turn research into scalable companies, stressing that the UK's commercialisation pipeline suffers from insufficient support for founders.

As noted in our previous report, increased capital investment would boost spinout numbers, but success depends on more than funding. Spinouts require sustained, varied support to navigate the "Valley of Death" and overcome commercialisation challenges. Yet the diversity of venture building activity means there is limited understanding of which support types matter most, when they are most critical and how increasing investment would shape future demand for venture building services. Addressing these knowledge gaps is, therefore, pivotal to ensuring the most appropriate intervention is provided at the right time for a spinout to achieve long-term success.[9]

8 Data Driven Analysis of Startup Accelerators, Regmi et al (2015).
9 Collaboration and Commercialisation, Innovate UK.

What is Venture Building?

The lack of a universal definition of venture building has resulted in a confusing ecosystem of support. Table One provides an overview of several venture building models that are identified as being most relevant to research commercialisation.

Table One: Types of Venture Building

Type	Support	Duration
Accelerators	Accelerators typically provide equity investment or investor access, workspace and networking through their cohort model. Many also offer mentoring, training and customer exposure. These programmes usually target very early-stage, pre-revenue ventures and require some return on investment for the organiser, unless they are supported by public subsidy.	Usually 3 – 6 months, up to a year
Entrepreneur in residence	Embeds a seasoned advisor into a new venture to provide hands-on support. Their role may include evaluating business ideas, conducting market research, assisting with fundraising, advising on product development, or being available as a sounding board and critical friend.	Can be either short term (3 – 6 months) or longer term, depending on the nature of the post
Venture capital, including VC plus	Some venture capital firms are willing to or even prefer to engage in venture creation and building, helping to construct a team and business plan around a particularly promising piece of technology. The "VC Plus" model extends this by providing additional start-up support beyond capital.	Cycles of 5 – 7 years
Challenge-led or venture scientist	Identifies market needs and challenges to articulate opportunities and then matches them with potential founders, rather than relying on founders to bring forward their own ideas.	No set timeline

Source: Henham Analysis. UKRI (Innovate UK), British Business Bank, LTSE.

Despite their difference, they have one key characteristic in common: they are designed to support early-stage companies in overcoming barriers, whether that be access to finance, or market entry. However, there is a significant lack of evidence on the provision, impact and structure of these models on early-stage businesses, let alone academic spinouts specifically.

Upon review of existing research, accelerators have been subject to the most comprehensive investigation. As such, for the purposes of this report, they have been used as a proxy for venture building, enabling us to examine the impact of venture building on spinouts.

The Accelerator Offer

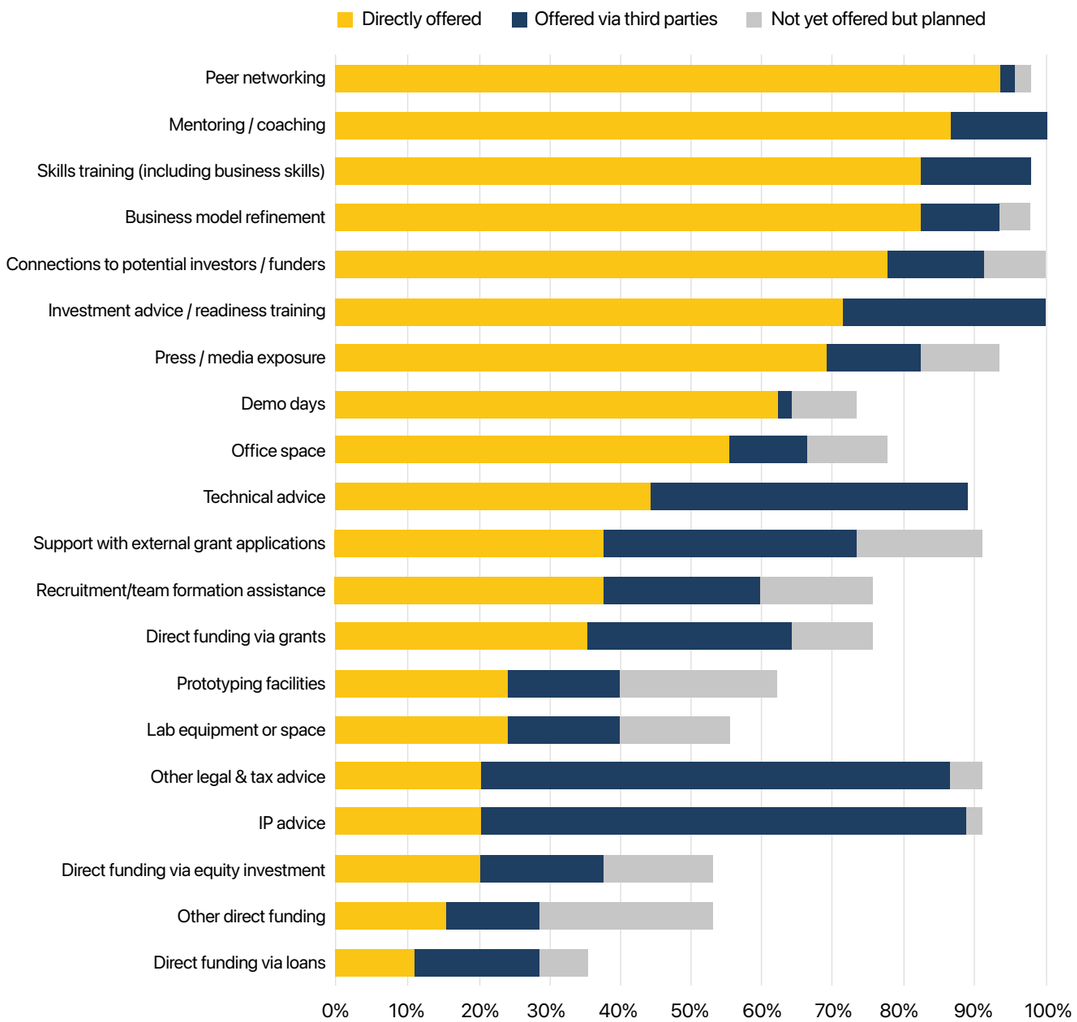
The number of accelerators in the UK has grown substantially, with reports showing an increase from 163 in 2017, to over 500 in 2025. However, since Q2 2025, the number of active spinout companies that have participated in an accelerator has started to decline, which raises questions as to whether they are providing the right type of support at the right moment.[10]

The types of support offered by accelerators showcases the diverse requirements of early-stage ventures. For instance, in 2022, the Centre for Entrepreneurs published a report outlining the services typically provided within an accelerator programme.

10 Business Incubators and Accelerators: The National Picture. BEIS.

Figure 1 shows the percentage of accelerator programmes that directly offer, offer via third parties, or plan to offer, various support services, and confirms key findings from our stakeholder engagement – that upskilling and advisory support is fundamental to early-stage success. For instance, all models include or plan to provide mentoring / coaching, investment advice and readiness training, mirroring stakeholder sentiment that the most pivotal support for a founder is assessing the commercial opportunity. Notably, more than 80% of accelerator programmes directly offer business model refinement - including customer discovery and commercial de-risking - underscoring its importance as a core early-stage component of successful commercialisation.

Figure 1: Services provided by self-identified accelerators



Source: Centre for Entrepreneurs

Whilst there are clear trends in terms of the type of support offered being weighted heavily towards skill development and knowledge transfer activity, it should also be noted that support types vary significantly, with funding, office space and equipment also offered, or planned to be offered, in over 50% of programmes.

When speaking to stakeholders about venture building activity, they stressed three important discrepancies:

1. **Venture building and skills are inseparable. Research excellence rarely comes with commercial expertise.** Upskilling academics to judge market viability is essential, making training and capability testing core components of effective venture building, as seen in leading accelerator models. UKRI's *Deepening University-Investor Links* report echoes these findings, identifying a cultural mismatch between universities and investors, calling for embedding entrepreneurship into academic career paths.[11]

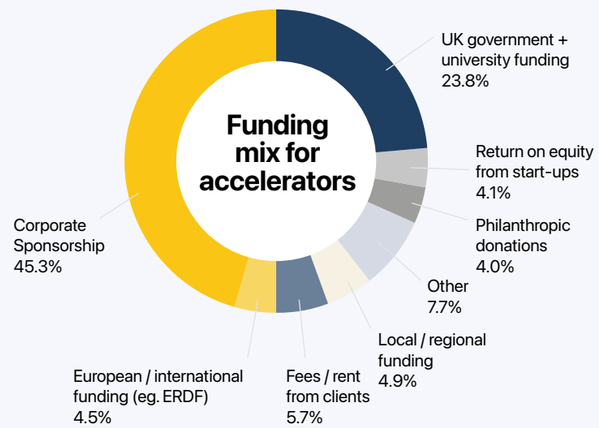
2. **Sector-specific support is essential.** As competition intensifies and sectors like deep-tech mature, accelerators need to increasingly specialise. Sector dynamics shape spinout lifecycles, for example, life sciences face long regulatory pathways and clinical trials, so support must be tailored, providing the right resources and timelines for each field.

3. **Venture building can be financed in multiple ways and is far from a one-size-fits-all model.** Whether supported through corporate accelerator investment or public funding, each source brings its own priorities and incentives. As a result, funding cannot be treated as 'equal', especially as support needs evolve along the commercialisation journey.

Funding Sources

The Centre for Entrepreneurs identified **four main funding models** for accelerators (and incubators): return on equity from start-ups, corporate sponsorship, service fees and public funding (including from universities). **Figure 2** highlights the central role of corporate sponsorship within the accelerator landscape, accounting for just over 40% of total funding. In contrast, government and universities together contribute less than a quarter. For spinouts, this implies significantly fewer opportunities within university-supported accelerator programmes.

Figure 2: Funding mix for accelerator programmes in the UK



Source: Centre for Entrepreneurs

11 Deepening University-Investor Links, UKRI.

Universities, local and national government, charities, and private businesses all invest in identifying and nurturing high potential companies at an early-stage. However, as noted by our stakeholders, certain types of funding may be more effective than others. Corporate investment in accelerators, for example, is typically underpinned by strategic objectives: companies seek access to innovative products, early insight into emerging market trends, opportunities to showcase their own offerings, and the potential for high return investments. Public investment, by contrast, can be targeted to address specific challenges at key stages in a spinout's development.

Building on the co-investment potential highlighted in Phase One, this distribution of funding models points to a significant opportunity for increased public investment which, when combined with strong corporate backing, could help meet growing demand for venture building support. However, stakeholders have highlighted the importance of sustained investment into venture building support.

Case Study

Sustained Venture Building Funding - Novo Nordisk Foundation and BioInnovation Institute (BII)[12]

The long-term partnership between the Novo Nordisk Foundation and the BioInnovation Institute (BII) is designed to accelerate the development and commercialisation of cutting edge biosolutions, supporting both the green transition and wider economic growth across Denmark and Europe. By combining the strengths of a major philanthropic foundation with the strategic investment expertise of a development finance institution, the collaboration demonstrates how public–private funding models can unlock sustainable and scalable innovation.

The ten year, EUR 400 million commitment blends grant funding, equity investment and tailored venture building programmes within a "founder-first" model. This approach provides early-stage companies with the capital, technical support and long term stability they need to progress breakthrough science toward market readiness.

The results illustrate the power of sustained, mission aligned investment:

- 74% of BII-supported start-ups go on to secure external capital
- More than 130 companies have been supported
- 21 products have been launched to market
- 8 therapeutic candidates have progressed into clinical trials

Together, Novo Nordisk Foundation and BII are setting a benchmark for how strategic, patient capital can translate into supporting early scientific innovation and subsequent commercial opportunities.

12 Novo Nordisk Foundation, 2026

Venture Building and the Taxonomy

As noted, the wide range of venture building support available makes it difficult to determine precisely where these interventions have the greatest impact in the commercialisation journey. However, by their nature, accelerators generally deliver the most value to early-stage companies.

We have mapped venture building across **Stage 2 - Opportunity Shaping to Stage 6 - Early Growth and Market Embedding.** Prior to Stage 2, we have assumed that there is no sufficient venture to build, with venture building having the greatest value-add potential once spinout founders are faced with assessing commercial viability. This is bolstered by UKRI's recent report's focus on venture building as early validation and better founder support. These stages broadly align with **TRLs 2–6,** encompassing stages that will benefit from multiple types of venture building support, from prototyping facilities to IP advice. Beyond **Stage 6,** we found that spinouts tend to shift towards scaling and operational growth, requiring broader business support or acumen rather than tailored venture building services.

However, it is important to note that accelerators typically target early-stage ventures, whilst other forms of venture building, such as scale-up programmes, are more useful to later-stage companies. As a result, whilst accelerators support a preliminary mapping of venture building onto the commercialisation taxonomy, it remains unclear if this allocation is optimal or how complementary models, such as entrepreneurs-in-residence, fit within the wider ecosystem.

Call for input

Venture building is a critical yet underdeveloped component of the UK's commercialisation system, with founders often struggling to access the right support at the right moment. The absence of a shared understanding of which interventions deliver the greatest impact, and when, means support is too often inconsistent, poorly sequenced, or difficult to navigate. Without a more coherent and equitable venture building ecosystem, the UK risks losing significant commercial potential as promising technologies fail to progress through key early-stage milestones. Strengthening and systemising venture building provision will therefore be essential to ensuring that research-led ventures can develop, validate and scale successfully.

To commercialise UK science at the level our Phase One analysis shows is possible, we are seeking input from policymakers, academia, Technology Transfer Offices, industry and Government to answer three crucial questions:

- What forms of venture building deliver the greatest impact?
- Is there a single most effective model for generating the highest quality commercial opportunities from UK research, or is a blended approach required?
- How should venture building activity be sustainably funded and how can we ensure that provision is equitable?

Please submit all responses to: beyondthecapitalgap@henhamstrategy.co.uk

Real Estate and Critical Equipment

Real estate and equipment refer to the mission critical laboratories, industrial spaces and advanced scientific instrumentation required by early-stage and high growth IP-led ventures to progress their development. These are facilities that extend well beyond conventional office premises.

The recent lack of critical laboratory space in Oxford and Cambridge resulted from an unanticipated rise in demand driven by substantial venture capital investment in early-stage innovation.

If we are to give companies the runway they need to launch and grow, we must anticipate the demand and deliver fit-for-purpose space and equipment in a timely manner.

To commercialise UK science at the level our Phase One analysis shows is possible, we are seeking input from policymakers, academia, industry and Government to answer four crucial questions:

- What types of specialist space will be required, and in which locations?
- How sector-specific or stage of development specific do these facilities need to be?
- Where can existing infrastructure be repurposed or upgraded, and where will entirely new development be necessary?
- What policy, systemic, cultural or economic barriers currently restrict the expansion of commercialisation-ready real estate?

Based on our targeted engagement with stakeholders and supporting research, we have set out the fundamental characteristics and trade-offs of real estate and equipment, as they apply to UK research commercialisation. We focus our analysis on the stages of the commercialisation journey where spinouts begin to exceed the capacity of their originating institutions and start to engage with the commercial property market. As a result, this report helps guide constructive collaboration in identifying the most appropriate strategy for anticipating spinout real estate and equipment needs.

Real Estate & Equipment and UK Research Commercialisation

All businesses need space to work, test and manufacture their products. However, as highly innovative companies, spinouts tend to have unique real estate and equipment demands, particularly in sectors where the UK spinout ecosystem thrives, such as life sciences, deep tech and advanced manufacturing.[13]

These companies will require a wide range of spaces to support different stages of commercialisation, from open plan environments that foster collaboration to specialist laboratories for prototyping and technology development. Yet the UK is already facing a shortage of innovation-ready real estate, a challenge that will only intensify if capital investment grows.

13 Spotlight on Spinouts, Beauhurst.

The House of Lords Committee, the Government and UKRI all recognise that real estate and equipment are fundamental to innovation, whether in acknowledging infrastructure gaps that hold companies back or stressing the need for strong institutional environments. However, the UK still lacks a clear, collective understanding of what infrastructure is required.

Understanding both the space requirements of future spinouts and the current capacity of our real estate infrastructure is therefore essential to building an ecosystem that supports, rather than constrains, innovation.

Real Estate & Equipment and the Taxonomy

The real estate and equipment needs of a spinout evolve in scale, specification and permanence as the commercialisation process progresses. These shifts reflect growing operational maturity and a gradual reduction in uncertainty around funding, staffing and commercial direction. Through stakeholder engagement, we have mapped real estate and equipment needs onto our taxonomy, to create a shared understanding of how these needs change over time.

Spinout activity in its earliest stages typically remains within the host university, with **Stages 1 – Discovery and Ideation to Stage 3A - Initial Technology Development: Proof of Concept** of our taxonomy relying on institutional labs, offices and shared facilities. This usually correlates to **TRLs 1–3,** when real estate or equipment needs are largely internal and fall outside the commercial property market.

From **Stage 3B - Later Validation and Translational Readiness, to Stage 6 - Early Growth and Market Embedding,** spinouts typically use temporary desks, shared labs and informal access rather than dedicated premises. With technologies reaching **TRLs 3–6,** they require laboratory and equipment access, but long leases and bespoke fit outs remain unsuitable due to funding and staffing uncertainty.

From **Stage 7 - Scaling to Stage 9 - Maturity,** spinouts become more established and develop more advanced real estate needs. They increasingly require larger, customised spaces to support operational pilots and scaling activity, including dedicated offices or laboratories, more equipment and clearer separation from university facilities to enable **TRLs 7–9.**

Real Estate Options for Spinouts

Initial assumptions often position "cheap laboratory space" as the primary real estate requirement for spinouts. However, stakeholder engagement shows that availability and flexibility matter far more than absolute cost.

Early-stage companies typically cannot afford - and do not want - to deploy scarce capital on fitting out specialist space. Converting generic buildings into laboratories is both time-consuming and expensive, and young companies rarely have long-term certainty of funding. The combination of uncertain timelines and limited capital means fitting out their own space is generally unattractive.

However, at present, it is often more cost-effective to acquire an existing building and strip it back to shell and core than to construct a new one. With construction costs typically starting at around £650 per sq. ft, for a new build, regardless of location, developers must charge rents above £60 per sq. ft to achieve a return-on-investment. Furthermore, securing a site, obtaining planning consent and designing and delivering new laboratory buildings usually takes 3–5 years, and most early-stage companies are simply unable or unwilling to commit to space this far in advance.[14]

14 Pioneer Group analysis

The cost of delivering these fully fitted laboratories is driven by three main components:

1. **Shell and core** – the base building structure, roof, cladding and primary frame.
2. **Enabling infrastructure** – mechanical and electrical systems, including air handling and specialist services.
3. **Fittings, fixtures and furniture** – walls, ceilings, flooring, lab benching and other internal elements.

There is also extreme regional disparity. Locations such as Central London, Oxford and Cambridge command very high prices, with specialist laboratory rents in the Golden Triangle now exceeding £85 per sq. ft, making investment into new developments more financially viable. Outside the Golden Triangle, however, lower rent prices means that developers cannot generate the returns needed to support new development. As a result, delivering new laboratory space outside the Golden Triangle is generally economically unviable, leading to an ongoing shortage of fit-for-purpose facilities and constraining regional growth. While regional companies could, in principle, afford higher rents if they were able to raise capital on par with Golden Triangle firms, new space must still be delivered ahead of, or exactly in line with, their growth needs. Given long development lead times, achieving this alignment is extremely challenging.

Furthermore, stakeholders, including those interviewed in Phase One, discussed the need for spinouts to be in or near existing sector clusters, enabling them to benefit from access to an established talent pool and associated supply chains. For example, written evidence provided by Science Creates (a deep tech ecosystem) to the House of Commons Science, Innovation, and Technology Committee in 2025, argued that incubators should be no more than a 20-minute commute from an R&D university.[15]

A Potential Solution? Key Characteristics of Incubators in the UK

An incubator is often a purpose-built facility designed to provide the types of space required by start-ups or spinouts. Whilst they don't meet all spinout real estate needs, they serve as a useful proxy for shared and fully fitted out facilities, enabling a more detailed analysis of real estate requirements for commercialisation.

The Centre for Entrepreneur's *Incubation Nation* identified 400+ incubators in the UK. Of these, 68.4% of incubators housed pre-revenue companies, 60.5% housed scaling companies and 44.7% housed companies at the ideation/concept development stages. This is compared to the quarter of incubators that house established companies.[16]

A 2017 BEIS study on business incubators and accelerators provides a list of characteristics incubators should demonstrate. While incubators vary widely in governance, funding models and service provision, the characteristics reflect common spatial requirements among early-stage companies:

1. Open ended duration
2. Rent or fee based
3. Focus on physical space over services
4. Admissions on ad-hoc (not cohort) basis
5. Provision of services including mentorship, entrepreneurial training
6. Technical facilities
7. Selective admission

15 Science Creates, House of Commons Science, Innovation and Technology Committee..
16 Incubation Nation, Centre for Entrepreneurs.

In speaking to stakeholders and examining the literature on incubators, two priority characteristics were highlighted as being fundamental to spinouts:

1. **Flexibility** - Early-stage spinouts must scale space up or down quickly as funding, research progress, or team size changes. Short-term leases, shared infrastructure and modular layouts suit them far better than traditional long-term commercial models.
2. **Access to equipment** – Once beyond the host institution, buying or leasing specialist equipment is prohibitively expensive. Shared facilities with wet labs, hoods and high spec analytical equipment therefore become essential.

Call for input

Real estate and equipment are not ancillary considerations but fundamental determinants of whether UK spinouts can survive, grow and ultimately scale. The mismatch between what ventures need and what the market can viably deliver, particularly outside the Golden Triangle, creates structural barriers that capital alone cannot overcome. If the companies generated by £15 billion of new investment are to have the runway they need, the UK must anticipate rising demand and deliver fit-for-purpose space and equipment at the pace required by fast moving companies. Achieving this will require coordinated action from policymakers, developers, universities and investors to ensure that space is flexible, affordable, appropriately located and available when companies need it.

To commercialise UK science at the level our Phase One analysis shows is possible, we are therefore seeking input from policymakers, academia, industry and Government on four crucial questions:

- What types of specialist space will be required, and in which locations?
- How sector-specific or stage of development specific do these facilities need to be?
- Where can existing infrastructure be repurposed or upgraded, and where will entirely new development be necessary?
- What policy, systemic, cultural or economic barriers currently restrict the expansion of commercialisation-ready real estate?

Talent and Skills

Talent and Skills refer to the technical skills base, entrepreneurial leadership and access to industry knowledge and networks that early-stage and fast growth IP-led ventures need to succeed.

The UK is experiencing critical demand for occupations that are pivotal to all stages of the commercialisation process and, importantly, the long-term success of the spun-out company. This does not include the £42bn of investment and co-investment Phase One has set out, and the 56,000 new jobs expected to be created from 1,771 new spinouts.[17]

If the UK's next generation of technology companies, fuelled by a wave of new venture capital, are to grow without constraint, we must address this fundamental skills shortage.

To commercialise UK science at the level our Phase One analysis shows is possible, policymakers, academia, industry and Government must join forces to answer several crucial questions:

- At which stages of the commercialisation journey is the skills gap most acute?
- Where could the use of Artificial Intelligence be most productive, without displacing talent?
- Where is upskilling or training the most effective way to address the gap, and where are recruitment or wider skills policy interventions more appropriate?
- What barriers exist to attracting relevant international talent to the UK?
- How can we enable skills and experience to diffuse beyond the Golden Triangle, so that new ventures can be developed and scaled at their point of origin?
- How can we ensure that opportunities for upskilling are made accessible and equitable for all founders, regardless of their location or background?

Based on our targeted engagement with stakeholders and supporting research, we have set out the fundamental skills requirements for UK research commercialisation, outlining where a skills shortage is most likely to occur following an increase in capital investment, and potentially stifle innovation. This report identifies these high-risk areas, providing a framework through which to assess skills policy around innovation.

Talent & Skills and UK Research Commercialisation

Across our stakeholder engagement, a clear consensus emerged: skills shortages are already constraining UK innovation. This has been a central theme in recent policy discussions. The House of Lords' Select Committee, HMG's response and UKRI's report all identify skills as a critical enabler of innovation, highlighting severe shortages and growing challenges in attracting global talent, both of which are undermining the UK's ability to scale science and technology companies.

Without targeted intervention, these pressures will intensify, particularly as further injections of capital, outlined in Phase One, increase demand across the system. The House of Lords emphasised that the UK does not currently have the skills base required to drive innovation and pointed to persistent talent leakage as a major risk. While the Government acknowledges these

17 Bridging the Capital Gap for UK Research Commercialisation, Pioneer Group

challenges and recognises that scaling companies require stronger training and talent pathways, UK research commercialisation brings an additional layer of complexity.

Effective commercialisation depends on a wide mix of capabilities: researchers generating a pipeline of opportunities, engineers translating ideas into prototypes and leaders with the commercial acumen to steer ventures through growth. Talent and skills planning is therefore not peripheral, it is a central pillar of the UK's commercialisation system, made even more critical by the broader, economy-wide shortages currently affecting the UK.

Talent & Skills and the Taxonomy

Innovate UK identifies **Knowledge, Technology and Business Development** as fundamental stages in the commercialisation process. Using this, alongside our taxonomy, we can map essential skills and occupations and forecast where demand will rise as capital investment in UK research commercialisation increases. This provides policymakers, universities and investors with a clearer understanding of where risks are highest and where interventions will have the greatest impact.[18]

Innovate UK and the 2025 Public Accounts Committee Review both emphasise strengthening research and analytical capacity to support idea generation and early commercialisation. Within Innovate UK's Valley of Death, this is characterised as **Knowledge Development,** which are a critical component of **Stage 1 - Discovery and Ideation and Stage 2 - Opportunity Shaping across TRLs 1–3.** These stages depend heavily on research capability and analytical skills, which are essential in generating viable commercial opportunities.[19, 20]

As ventures progress into validation and development, skills needs shift to those with industrial experience across STEM fields. As a result, roles at this stage in the process are critical for moving technologies from concept to prototype to market-ready product. Innovate UK characterises this as **Technology Development,** which aligns with **Stage 3 – Validation & Proof-of-Concept** of our taxonomy, and spans **TRLs 3–9.** This covers activities from early validation to market readiness, and involves the technical aspects of commercialisation, where products or technologies are built and validated. However, unlike knowledge creation, these capabilities are highly sector-specific, requiring deep expertise to advance technology from concept to market.

The transition from a promising technology to a viable commercial venture hinges on leadership capability. From **Stage 4 - Spinout Approval and Deal Structuring** through to **Stage 9 – Maturity,** such capability becomes critical in setting an academic spinout up for long-term success. Termed, the **Business Development** stage by Innovate UK, it spans and requires a diverse set of professional roles. In TRL terms, this corresponds to the later-stages, where the product is closer to being "market-ready". Skills required include IP and legal expertise during spinout approval, commercial leadership during formation and early growth and financial, strategic and operational leadership during scaling and maturity.

Understanding the Scale of the Challenge

Our taxonomy, alongside Innovate UK's Valley of Death, provides a useful breakdown of the skills diversity required across the commercialisation journey. However, to understand the scale of the challenge in meeting these skills requirements, we must first ascertain how this translates into demand for specific occupations. Projections from the UK Skills Imperative 2035 and Skills England, and its Demand Index, reveal that the UK is entering a period of **sustained and intensifying skills pressure** across every cluster of occupations required for successful research commercialisation. These pressures exist today, but the capital injection forecast in Phase One will accelerate demand at a pace the current system is not positioned to meet.[21, 22]

18 Collaboration and Commercialisation, UKRI (Innovate UK)
19 Public Accounts Committee (2025)
20 Commercialising your research outputs. UCL.
21 UK Skills Imperative 2035, Skills England.
22 The Demand Index ranks UK occupations using seven key indicators, such as visa applications and annual wage growth, to identify which roles are under the most strain. Occupations scoring 0.39 or higher are classified as critical demand, while those between 0.004 and 0.39 fall into the elevated demand category. Roles with a score below 0.004 are considered not in high demand.

Understanding the Policy Direction

Recent policy activity indicates growing recognition that the UK's commercialisation ambitions depend on a stronger, more resilient skills base. Several initiatives demonstrate this shift:

- **The £54 million Global Talent Fund (2025)** signals a clearer commitment to attracting high quality researchers in strategic sectors.[23]
- **The expansion of technical pathways,** including Degree Apprenticeships and an increase in scientific R&D apprenticeship starts - rising from 740 in 2020/21 to 900 in 2022/23 - reflects gradual strengthening of analytical and technical capability at the earliest stages of commercialisation.[24]
- **UKRI's growing emphasis on researcher development and entrepreneurship training** is helping more academics and early career researchers build the foundational capabilities required to move discoveries toward commercial opportunity.[25]

While these measures reinforce the research base - a critical precursor to effective commercialisation - stakeholders emphasised that practical barriers continue to undermine the UK's ability to meet skills demand. Visa complexity, administrative burden, intense global competition for talent and uncompetitive salaries, all constrain the UK's ability to rely on international recruitment to fill the most acute gaps. Stakeholders also made clear that training alone cannot generate the volume of experienced commercial leaders required as ventures move into later-stage development and scale.

Overall, the policy landscape is moving in the right direction but remains incomplete. Current interventions broaden the early-stage talent pipeline and strengthen foundational research capability, yet they do not fully address the concentration of demand at key stages of the commercialisation journey, the persistent barriers to attracting international expertise, or the uneven distribution of skills and leadership outside the Golden Triangle. As investment accelerates and more ventures emerge, the effectiveness of existing policy will depend on whether it can evolve to meet the scale, timing and geography of the UK's growing commercialisation needs.

A Growing Gap Between Demand and Supply

The UK is already operating with a significant skills deficit, particularly across specialist STEM roles, analytical and research occupations and commercial leadership. Across each stage of the commercialisation pathway, multiple roles are classified as being in elevated or critical demand.

The Skills Imperative 2035 highlights that even under baseline economic conditions, without factoring in new spinout creation, key innovation intensive occupations are expected to grow by **4–5% over the next five years.** When combined with the projected uplift in demand from new ventures, the existing shortages risk compounding into systemic constraints. Across the taxonomy the implications are striking:

- **Knowledge Development roles,** such as researchers and early-stage technical staff, already face elevated demand, with an average Demand Index score of 0.12. Without strengthening the pipeline of research and analytical talent, both the volume and quality of commercialisation-ready research will decline.
- **Technology Development roles,** including engineering, laboratory and IT-related positions, are experiencing some of the highest pressure in the labour market, with many facing elevated or critical demand. Engineering, laboratory and IT occupations already sit within some of the highest pressure SOC categories, with shortages likely to deepen as more ventures enter the market.

23 Global Talent Fund, UKRI
24 The Apprenticeship Guide.
25 UKRI (Innovate UK)

- **Business Development roles,** particularly C-suite teams capable of scaling high growth, research intensive spinouts, represent the most severe bottleneck – displaying a Demand Index score of 0.88, underscoring the exceptional and cross-sector demand for experienced commercial leadership. By 2035, the demand for leaders with strong commercial, relational and investor-facing capabilities will far exceed current supply. Stakeholder interviews repeatedly emphasised that the absence of experienced leaders, not the weakness of underlying technologies, is the most common point of failure.[26]

The data and our stakeholder engagement point to the same conclusion: **skills shortages are already constraining UK innovation, and the challenge is set to worsen.** Yet the breadth of these shortages presents a policy dilemma: **where should attention be focused?** Every capability - scientific, technical, operational, commercial - is fundamental to the lifespan of an academic spinout, making prioritisation appear almost impossible.

Nevertheless, a consistent theme emerged throughout our stakeholder conversations: the absence of experienced CEOs is the single most significant barrier to scaling UK spinouts. Ventures require leaders with exceptional commercial judgement, relationship-building skills and investor-facing capabilities to attract both talent and capital. However, that's not to say that policy should be focused on simply attracting international CEOs. Entrepreneurial capability, from the earliest stages of commercialisation, is pivotal to long-term success. Critical activities such as early customer discovery and commercial de-risking are often postponed until much later in the process, leading to missed opportunities for product refinement that could ultimately strengthen the venture's success. As a result, upskilling may provide a more sustainable approach to filling this critical skills gap.[27]

Call for input

These findings make clear that talent and skills shortages are not a future threat, they are a present and rapidly intensifying barrier to UK research commercialisation. As investment accelerates and more ventures are created, demand for technical, analytical and commercial leadership talent will grow far faster than the current system can supply. This pressure is particularly acute outside the Golden Triangle, where existing gaps are already more pronounced. Strengthening pathways into these roles, investing in deeper upskilling and improving access to global expertise will be essential if research-led ventures are to develop, scale and compete internationally.

Yet addressing this challenge will require coordinated action. Real progress depends on policymakers, academia, industry and Government working together to unlock the full commercial potential of UK science, potential that our Phase One analysis shows is well within reach. We are therefore seeking input on several critical questions:

- At which stages of the commercialisation journey is the skills gap most acute?
- Where could the use of Artificial Intelligence be most productive, without displacing talent?
- Where is upskilling or training the most effective way to address the gap, and where are recruitment or wider skills policy interventions more appropriate?
- What barriers exist to attracting relevant international talent to the UK?
- How can we enable skills and experience to diffuse beyond the Golden Triangle, so that new ventures can be developed and scaled at their point of origin?
- How can we ensure that opportunities for upskilling are made accessible and equitable for all founders, regardless of their location or background?

Conclusion

***Bridging the Capital Gap for UK Research Commercialisation* demonstrated the strength of the UK's innovation ecosystem and the critical role of capital investment in unlocking commercial opportunities, driving innovation and creating jobs. But it also showed, unequivocally, that money alone does not create successful ventures. Spinouts require a broader foundation: venture building support, access to real estate and specialist equipment and a deep pipeline of skills and talent. At present, the UK is not fully equipped to provide these essential components, without them, we risk failing to capitalise on increased investment and jeopardising the long-term sustainability of funding.**

Since Phase One, this message has only grown louder. The House of Lords Science and Technology Select Committee warned of a national "growth emergency," driven by structural weaknesses across science, innovation, infrastructure and commercialisation systems. HMG's response recognised these long-standing challenges, acknowledging decades old barriers that hinder companies at each step of their scaling journey. Meanwhile, UKRI's Deepening *University–Investor* Links report echoed the same conclusion: the UK faces gaps not only in pre-seed and scale-up finance, but also in institutional capability, consistency of support and the quality of the environment in which spinouts are formed.[28]

Taken together, these reports make one thing unmistakably clear: **the UK is aligned in diagnosing the problem, and now is the moment for industry and government to work together to design the solution.**

To truly harness the benefits of the UK's research base and maximise returns on rising levels of capital, strategic and equitable investment in the complementary foundations of commercialisation is essential. This means building the infrastructure, skills and venture building capacity that enable research to become investment-ready, scalable businesses and removing the specific barriers faced by minority groups to unlock even greater economic benefit. It also means recognising that the commercialisation journey is complex and heterogeneous: there is no single intervention that will work for every discipline, institution or region. Tailored, targeted policy is required to prepare the UK for future technological waves, foster innovation across sectors and unlock the full commercial potential of research.

We would like to invite comment and discussion on this report to inform our engagement with policymakers, universities, investors and other stakeholders. Your insight will help us shape clear, actionable recommendations that enable government, academia and industry to collaborate effectively, and position the UK's innovation ecosystem for long-term success.
